# Management Protocol of COVID-19

Government of West Bengal

## COVID-19 Suspects

- SYMPTOMATIC individuals or Contacts of confirmed cases
- SYMPTOMATIC health care workers (HCWs)
- Severe Acute Respiratory Illness (SARI)
- ASYMPTOMATIC direct contacts or HCWs exposed without adequate protective measures (to be tested within day 5 to day 14 of contact)

### MILD Disease

Fever, Cough, Malaise, Sore Throat without Shortness of Breath

### MODERATE Disease

FEVER  $\geq 100^{\circ}$  F with or without Cough, Sore Throat, Myalgia, Difficulty in Breathing.

#### PLUS

ANY ONE of the following:

1. Respiratory Rate  $> 24/\text{min}$ ,
2.  $\text{SpO}_2 < 95\%$  in room air
3. Altered sensorium – Drowsiness / Confusion / Stupor
4. Infiltrates on chest X-ray
5. Altered Liver Function Test / Renal Function Test

### SEVERE Disease

Moderate disease with ARDS and/or, Sepsis with MODS and/or, Septic Shock. SBP  $< 90$  or, DBP  $< 60$  mmHg

For Asymptomatic contacts or HCWs TEST without Admission; For Mild Symptomatic Cases ADMIT at **Level-1** and TEST; For Moderate/Severe cases ADMIT at **Level-2** and TEST

### Test POSITIVE Mild Case

- Conditional Home Isolation, if facility available
- Isolation at **Level-3**
- Paracetamol
- Oral Fluids
- Look for danger signs
- Hydroxychloroquine for High Risk group

### Test NEGATIVE Mild Case

Symptomatic Management & Plan for Discharge, if admitted in Level-1

### Test NEGATIVE Moderate / Severe Case

Repeat Test after 5 days, for Strong Suspects. Look for other etiology, if still NEGATIVE

### Test POSITIVE Moderate / Severe Case

Send to **Level-4**

- Oxygenation
- Paracetamol
- MDI (avoid nebulization)
- Hydroxychloroquine
- Anticoagulation, LMWH
- Chest X-Ray, ECG, ABG, CBC, LFT, RFT, D-Dimer
- PT, APTT, Ferritin, Trop-T

- Respiratory failure requiring mechanical ventilation
- Hypotension requiring vasopressor support
- Worsening of mental state
- Multi-Organ Dysfunction

Refer to ICU

- NIV or HFNC to be used carefully in view of aerosol generation
- Ventilation as per ARDS protocol
- Standard care for ventilated patients
- Conservative fluid management in hemodynamically stable patient
- Antibiotics for sepsis in  $< 1$  hour after sending blood / urine culture
- Closed suction and HME filters
- ECMO for refractory cases
- Corticosteroid, Anti-Coagulant, Tocilizumab, Convalescent Plasma

**DISCHARGE & Advice Home Isolation for 7 days**

- In Severe Cases including Immunocompromised, HIV pts., Transplant recipients & Malignancy
- Clinical Recovery
- Tested negative once by RT-PCR after resolution of symptom

- Afebrile for 3 days
- 10 days passed from onset of symptoms

- Fever resolved within 3 days
- $\text{SpO}_2 > 95\%$  for next 4 days
- No need of oxygen
- 10 days passed from onset of symptoms

- Where Symptoms and low  $\text{SpO}_2$  prolonged
- Resolution of clinical symptoms, as well as
- $\text{SpO}_2 > 95\%$  without oxygen for 3 consecutive days

### Stratify High Risk Cases

- Age  $> 60$  years
- Chronic Lung Diseases
- Chronic Liver Disease
- Chronic Kidney Disease
- Hypertension
- Cardiovascular disease
- Cerebrovascular disease
- Poorly controlled Diabetes
- HIV
- Cancers
- Immunosuppressive drugs

Send to **Level-4**

1.	<b>Hydroxychloroquine.</b> Dose : 400 mg BD on day one, then 400 mg OD x 4 days. Adverse Effects : Gastrointestinal, QT Prolongation in ECG. Contraindication : QTc >500 mSec, Myasthenia Gravis, Porphyria, Retinal Pathology, Epilepsy. Pregnancy is not a contraindication
2.	<b>Tocilizumab.</b> May be considered in Moderate / Severe cases, if IL-6 is more than 5 times of the Upper Limit of Normal (ULN). Recommended first dose is 400 mg (4 - 8 mg/kg) in 100 ml NS, over >1 hour. For patients with poor initial efficacy, an additional 400 mg can be repeated after 12 hours. Maximum number of administration is two times, and maximum single dose is 800 mg. Not recommended in patients with active hepatic disease or hepatic impairment with baseline ALT or AST >1.5 times of ULN
3.	<b>Corticosteroids.</b> Methylprednisolone 1- 2mg/kg/day or equivalent may be used for a short period of time of 3 to 5 days in patients with progressive worsening of oxygenation indicators, imaging and excessive activation of body's inflammatory response.
4.	<b>Anti-Coagulation.</b> Low Molecular Weight Heparin e.g. Enoxaparin 1mg/kg/day, SC, in moderate to severe patients with increased D-dimer level, P-time, APTT, or with features of DIC or Hypercoagulability, or in patients requiring DVT prophylaxis.
5.	<b>Convalescent Plasma Transfusion.</b> May be considered in Moderate / Severe cases, if there is progressive worsening of condition

#### Mandatory Monitoring:

- Body temperature at regular interval
- Pulse oximetry monitoring for SpO<sub>2</sub>
- Vital Signs

#### Tests Required:

- CBC, Urea, Creatinine, LFT, Sugar, Na<sup>+</sup>, K<sup>+</sup>, Pulse Oximetry, ABG
- ECG at presentation. If initial QTc >450 mSecs, try to avoid quinolones/macrolides in them or monitor QTc closely
- Chest X Ray at presentation and then as needed
- Serum Ferritin, LDH, CRP, Trop-T, Lactate for assessment of prognosis in moderate to severe patients
- D-Dimer, P-Time, APTT, Platelet to assess the need for Anti-coagulants in moderate to severe patients
- Blood Culture, Urine Culture, Procalcitonin to assess the need for Antibiotics in moderate to severe patients

#### Discharge Criteria:

- Mild / Very Mild / Pre-symptomatic cases can be discharged after 10 days of symptom onset and no fever for 3 days
- Moderate cases whose symptoms resolve within 3 days and maintains SpO<sub>2</sub> above 95% for next 4 days can be discharged after 10 days of symptom onset if there is Absence of fever without Paracetamol, Resolution of breathlessness and No oxygen requirement
- Moderate to severe cases whose fever does not resolve within 3 days and demand of oxygen therapy continues can be discharged only after Resolution of clinical symptoms and ability to maintain oxygen saturation above 95% for 3 consecutive days
- Severe Cases (including Immunocompromised patients, HIV patients, Transplant recipients and Malignancy) can be discharged only after Clinical recovery and the patient's swab test becomes negative once by RT-PCR after resolution of symptoms

#### Follow Up:

- Home isolation for further 7 days after discharge
- Follow up after 2 weeks and 4 weeks, or as required in between

#### Chemoprophylaxis : Hydroxychloroquine Recommended for Chemoprophylaxis of COVID-19 (Dose as per ICMR Guidelines)

1. For Asymptomatic HCWs in the treatment of suspect and confirmed patients : Dose is 400 mg BDPC on day 1, followed by 400 mg once weekly for 7 weeks
2. For Asymptomatic household contacts of laboratory confirmed cases : Dose is 400 mg BDPC on day 1, followed by 400 mg once weekly for 3 weeks

#### Contraindications:

Children below 15 years, known case of Retinopathy and History of Hypersensitivity to Hydroxychloroquine

#### Key Considerations:

1. Drug to be used only under prescription of a Registered Medical Practitioner
2. Consult doctor in cases of drug reaction
3. All asymptomatic contacts should remain in home isolation.
4. Asymptomatic individuals showing symptoms should immediately seek medical advice

Status of the Patient	COVID Hospital Levels	According to severity Level 1 and 2 are for COVID Suspects According to severity Level 3 and 4 are for COVID Cases
Suspected Mild Case, Not Yet Tested	Level 1	
Suspected Moderate / Severe Case (SARI), Not Yet Tested	Level 2	
Test Confirmed Mild Case	Level 3	Positive Cases and Not-yet-Tested Suspects Must Not Be Kept in the Same COVID Hospital Building
Test Confirmed Moderate / Severe Case And	Level 4	
Test Confirmed Mild Case with High Risk		

# **TOP SHEET FOR THE MANAGEMENT OF COVID-19 PATIENTS**

## **PATIENT DETAILS**

<b>Name-</b>	<b>Age-</b>	<b>Gender-</b>

# **GENERAL PRINCIPLES**

## **GENERAL PRINCIPLE FOR OUTDOOR SETTINGS IN ALL HOSPITALS**

1. Screening of patients with fever and respiratory tract symptoms in dedicated fever clinics
2. All patients attending fever clinic must wear a face mask, or may be provided with a mask
3. Maintain more than one-meter distance from patient
4. Use appropriate PPE while seeing patients
5. Avoid face-to-face sitting with the patients

## **GENERAL PRINCIPLE FOR INDOOR SETTINGS IN COVID HOSPITALS**

1. All patients Must Always wear a 3-layer surgical mask after admission
2. No family member will be allowed in patient areas to meet the patient
3. Patient will not be allowed to carry any phone/mobile inside the ward along with him/her
4. A designated help line will communicate patient relatives about the patient's condition
5. Separate lifts should be used to transport the patients
6. Patients should be placed in single rooms. If single rooms are not available, patients should be placed sufficiently apart. Distance between two beds should be more than one meter preferably 2 meters.
7. All the paper works, e.g. writing notes in BHT or Treatment Cards should be done in a separate area.
8. Avoid moving and transporting patients out of their room unless medically necessary
9. Clean Environmental surfaces with detergents and 1% Sodium Hypochlorite solution
10. Manage Laundry, Food Service, Utensils and Medical Waste with safe routine procedures

## **PROTECTIVE GEARS FOR THE HEALTH CARE WORKERS (HCWs)**

1. **Health Care Workers (HCWs)** should refrain from touching own Mouth, Nose or Eyes with potentially contaminated gloved or bare hands, and touching the surfaces
2. **HCWs to Practise Hand Hygiene**
  - Before touching a patient
  - Before any clean or aseptic procedure is performed
  - After exposure to body fluid
  - After touching a patient, and after touching the patient's surroundings

- Alcohol-based hand rub (ABHR) preferred if hands are not visibly soiled, Soap and water preferred when they are visibly soiled
- After examining each patient, they must wash their hands (with gloves on) with soap water or ABHR sanitisers

**3. Full Set of PPE (Personal Protective Equipment) includes**

- N-95 mask
  - Eye protection (Goggles) or facial protection (face shield)
  - Clean, non-sterile, coverall, long sleeved gown
  - Head Cover
  - Gloves
  - Shoe Cover
4. Donning and doffing of PPEs to be done in separate areas with separate entry and exit
5. **Identify donning and doffing areas in each floor with hand washing facilities**
6. **Advisory of Level of PPE in accordance with the level of Risk**

Area	HCW Category	Risk Level	Recommended PPE	Comment
• Triage Area in OPD • Doctors Chamber at OPD	• Doctor • Sister • Sanitary Staff	Moderate	N-95 Mask and Gloves	Aerosol Generating Procedure Not Allowed
• OPD	• Patient • Patient Party	Low	Triple Layer Medical Mask	Should Practice Hand Hygiene
• Emergency Depart Attending Non-SARI	• Doctor • Sister	Moderate	N-95 Mask and Gloves	Do
• Emergency Depart Attending SARI Pts.	• Doctor • Sister	High	Full Set of PPE	Aerosol Generating Procedure, only if absolutely needed
• Isolation Ward • COVID Ward	• Doctor • Sister	High	Full Set of PPE	Do
• Critical Care Unit	• Doctor • Sister • Technician	High	Full Set of PPE	Do
• Lift Service	• Liftman	Moderate	N-95 Mask and Gloves	Operating Lifts that Carry Patients

Area	HCW Category	Risk Level	Recommended PPE	Comment
• Laboratory	• Doctor • Technician	High	Full Set of PPE	Sample Collection & Transport & Testing
• Sanitation	• Sanitary Staff	Moderate	N-95 Mask and Gloves	Cleaning Surfaces, Floor and Changing Linen
• Mortuary • ICU	• Dead Body Handling Staff	Moderate	N-95 Mask and Gloves	Dead Body Handling
• Administration • Maintenance PWD	• Administrator • Accountant • Engineering	No Risk	No PPE	Administrative office Maintenance

### **CORRECT SEQUENCE OF DONNING AND DOFFING OF PPE**

<b>CORRECT SEQUENCE FOR <i>DONNING</i> PERSONAL PROTECTIVE EQUIPMENT (PPE)</b>	<b>CORRECT SEQUENCE FOR <i>REMOVING</i> PERSONAL PROTECTIVE EQUIPMENT (PPE)</b>
<p>The type of PPE used will vary based on the level of precautions required; e.g., Standard and Contact, Droplet or Airborne Infection Isolation.</p> <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Remove hand jewellery and tie back hair.</div> <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Clean and dry hands thoroughly.</div> <ol style="list-style-type: none"> <li>1. <b>GOWN / APRON</b>            Fully cover torso from neck to knees, arms to end of wrists, and wrap around the back            Fasten in back of neck and waist   </li> <li>2. <b>MASK OR RESPIRATOR</b>            Secure ties or elastic bands at middle of head and neck            Fit flexible band to nose bridge            Fit snug to face and below chin            Fit-check respirator   </li> <li>3. <b>GOGGLES OR FACE SHIELD</b>            If you wear glasses put them on.            Place goggles or face shield over face and eyes and adjust to fit   </li> <li>4. <b>GLOVES</b>            Extend to cover wrist   </li> </ol>	<ol style="list-style-type: none"> <li>1. <b>GLOVES</b>  <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Outside of gloves are contaminated—DO NOT TOUCH!</div>           Grasp outside of glove with opposite gloved hand; peel off            Hold removed glove in gloved hand            Slide fingers of ungloved hand under remaining glove at wrist            Peel glove off over first glove            Discard gloves in waste container            Clean and dry your hands thoroughly   </li> <li>2. <b>GOGGLES OR FACE SHIELD</b>  <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Outside of goggles or face shield are contaminated—DO NOT TOUCH!</div>           To remove, handle by head band or ear pieces            Place in designated receptacle for reprocessing or in waste container            Clean and dry your hands thoroughly   </li> <li>3. <b>GOWN / APRON</b>  <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Gown front and sleeves are contaminated—DO NOT TOUCH!</div>           Unfasten ties            Pull away from neck and shoulders, touching inside of gown only            Turn gown inside out            Fold or roll into a bundle and discard            Clean and dry your hands thoroughly   </li> <li>4. <b>MASK OR RESPIRATOR</b>  <div style="border: 1px solid black; padding: 2px; text-align: center; margin: 5px 0;">Front of mask/respirator is contaminated—DO NOT TOUCH!</div>           Grasp bottom, then top ties or elastics and remove            Discard in waste container            Clean and dry your hands thoroughly   </li> </ol>

Capital & Coast District Health Board  
 OPOKO KI TE URU HAUORA Infection control January 2005. Developed using CDC Guidelines 2005

## **METHODS FOR SPECIMEN COLLECTION AND TRANSPORT**

### **SPECIMEN COLLECTOR MUST WEAR FULL PPE**

#### **1. Specimens Collection**

- **Nasopharyngeal Swab:** Insert flexible wire shaft minitip swab through the nares parallel to the palate (not upwards) until resistance is encountered indicating contact with the nasopharynx.
  - Swab should reach the depth equal to distance from nostrils to outer opening of the ear.
  - Gently rub and roll the swab.
  - Leave swab in place for several seconds to absorb secretions.
  - Slowly remove swab while rotating it.
- **Oropharyngeal Swab (Throat Swab):** Insert swab into the
  - Posterior pharynx and tonsillar areas.
  - Rub swab over both tonsillar pillars and posterior oropharynx
  - Avoid touching the tongue, teeth, and gums.

#### **2. Storage**

- Place swabs immediately into sterile tubes containing 2-3 mL of Viral Transport Media.
- Store specimens at 2 - 8°C for up to 72 hours after collection.

#### **3. Transport**

- Send the sample specimen in Viral Transport Media to Testing Centre immediately
- If delayed, store specimens at 2-8°C, and transport overnight on ice pack.

## **CASE DEFINITIONS**

### **CASE DEFINITION OF CONFIRMED CASE**

- A person with laboratory confirmed infection of COVID-19, by RT PCR irrespective of clinical signs and symptoms

### **CASE DEFINITION OF SUSPECT**

- Patient with Fever + Acute Respiratory Illness e.g. Cough / Sore Throat / Respiratory Distress AND a history of travel in last 14 days to an area or territory, or a history of residence in an area or territory, which is reporting local transmission of COVID-19
- Patient with Acute Respiratory Illness who came in Contact with a Confirmed case within last 14 days
- Symptomatic Health Care Worker without any contact history with a Confirmed case
- Asymptomatic Health Care Worker or an asymptomatic close family member who came in Contact with a Confirmed case within last 14 days
- All Patients with Severe Acute Respiratory Illness (SARI)
- A case in whom the COVID-19 test report is inconclusive

### **CASE DEFINITION OF MILD DISEASE**

**FEVER**  $\geq 100^{\circ}$  F with Cough, Sore Throat, Malaise, Myalgia, without Shortness of Breath

### **CASE DEFINITION OF MODERATE DISEASE**

**FEVER**  $\geq 100^{\circ}$  F with or without Respiratory Symptoms - Cough, Sore Throat, Myalgia, Difficulty in Breathing

**PLUS, ANY ONE** of the following:

1. Respiratory Rate  $> 24/\text{min}$ ,
2.  $\text{SpO}_2 < 95\%$  in room air
3. Altered Sensorium - Drowsiness / Confusion / Stupor
4. Infiltrates on Chest X-ray.
5. Altered Liver Function Test or Renal Function Test

### **CASE DEFINITION OF SEVERE DISEASE**

Case with **Moderate Disease Plus ARDS / Acute Respiratory Failure** and/or, **Sepsis with Multi-Organ Dysfunction Syndrome** and/or, **Septic Shock**

## ARDS

Adults	Children
<ul style="list-style-type: none"> <li>• <b>Mild ARDS:</b> <math>\text{PaO}_2/\text{FiO}_2 &gt; 200 - \leq 300</math> mmHg (with PEEP or CPAP <math>\geq 5</math> cm <math>\text{H}_2\text{O}</math>, or non-ventilated)</li> <li>• <b>Moderate ARDS:</b> <math>\text{PaO}_2/\text{FiO}_2 &gt; 100 - \leq 200</math> mmHg (with PEEP <math>\geq 5</math> cm <math>\text{H}_2\text{O}</math>, or non-ventilated)</li> <li>• <b>Severe ARDS:</b> <math>\text{PaO}_2/\text{FiO}_2 \leq 100</math> mmHg (with PEEP <math>\geq 5</math> cm <math>\text{H}_2\text{O}</math>, or non-ventilated)</li> <li>• When <math>\text{PaO}_2</math> is not available, <math>\text{SpO}_2/\text{FiO}_2 \leq 315</math> mmHg suggests ARDS (including in non-ventilated patients)</li> </ul>	<ul style="list-style-type: none"> <li>• Bi-PAP or CPAP <math>\geq 5</math> cm <math>\text{H}_2\text{O}</math> via full face mask: <math>\text{PaO}_2/\text{FiO}_2 \leq 300</math> or <math>\text{SpO}_2/\text{FiO}_2 \leq 264</math></li> <li>• Mild ARDS (invasively ventilated): <math>\text{OI} \geq 4 - &lt; 8</math> or, <math>\text{OSI} \geq 5 - &lt; 7.5</math></li> <li>• Moderate ARDS (invasively ventilated): <math>\text{OI} \geq 8 - &lt; 16</math> or, <math>\text{OSI} \geq 7.5 - &lt; 12.3</math></li> <li>• Severe ARDS (invasively ventilated): <math>\text{OI} \geq 16</math> or, <math>\text{OSI} \geq 12.3</math></li> </ul> <p><math>\text{OI}</math> = Oxygenation Index and  <math>\text{OSI}</math> = Oxygenation Index using <math>\text{SpO}_2</math></p>

## SEPSIS : SOFA Score $\geq 2$

Sepsis	SOFA (Total Score 0 – 24)
Life threatening organ dysfunction caused by a dysregulated host response to suspected or proven infection	1. $\text{PaO}_2\text{-FiO}_2$ Ratio (Score 0 – 4)
	2. Platelet Count (Score 0 – 4)
	3. Bilirubin (Score 0 – 4)
	4. Glasgow Coma Scale (Score 0 – 4)
	5. MAP & Vasopressor Requirement (Score 0 – 4)
	6. Creatinine and / or Urine Output (Score 0 – 4)
	Sepsis = $\text{SOFA} \geq 2$ (Baseline score to be assumed as Zero if data not available)

## SEPTIC SHOCK

Adults	Children
Persisting hypotension despite volume resuscitation, requiring vasopressors to maintain MAP $\geq 65$ mmHg and serum lactate level $> 2$ mmol/L	<p>Any Hypotension (SBP 2 SD below normal for age)  <b>Or,</b>  Any Two of the following :-</p> <ol style="list-style-type: none"> <li>1. Altered mental state</li> <li>2. Bradycardia or tachycardia (HR 160 bpm in infants and HR 150 bpm in children)</li> <li>3. Prolonged capillary refill (<math>&gt; 2</math> sec) or warm vasodilation with bounding pulses</li> <li>4. Tachypnea</li> <li>5. Mottled skin or petechial or purpuric rash</li> <li>6. increased lactate</li> <li>7. Oliguria</li> <li>8. Hyperthermia or hypothermia.</li> </ol>

## **TRIAGE**

<b>Cases</b>	<b>COVID Hospital Levels</b>
<b>Suspected Mild Case</b>	<b>Level 1</b>
<b>Suspected Moderate / Severe Case (SARI)</b>	<b>Level 2</b>
<b>Test Confirmed Mild Case</b>	<b>Level 3</b>
<b>Test Confirmed Moderate / Severe Case AND Test Confirmed Mild Case with High Risk*</b>	<b>Level 4</b>

\* [Patients with Age > 60 years; Chronic Lung Diseases; Chronic Liver Disease; Chronic Kidney Disease; Hypertension; Cardiovascular Disease; Cerebrovascular Disease; Diabetes; HIV; Cancers; on Immunosuppressive drugs.]

**A. According to severity Level 1 and Level 2 COVID Hospitals are for COVID Suspects**

**B. According to severity Level 3 and Level 4 COVID Hospitals are for COVID Cases**

**N.B.**

<b>Suspects and Positive Cases Must Not Be Kept in the Same COVID Hospital Building</b>
---

<b>Patient will be Transferred to Appropriate Level according to the Report and the Severity</b>
--

## **MANAGEMENT OF MILD CASES**

### **Following Parameters Should Be Observed By Doctor / Sister During Daily Rounds and Recorded Thrice Daily / On Worsening of Symptoms**

1. Temperature
2. SpO<sub>2</sub> (By Pulse Oximeter)
3. Blood Pressure
4. Sensorium (conscious, drowsy or stupor)
5. Pulse
6. Respiratory Rate
7. Urine Output
8. Chest Examination - Breath sound, crepitations and rhonchi

**First Seven Features May Be Checked By The On Duty Sister.**

**First Five Parameters Are Essential and Must Be Recorded Time to Time in Each Shift and duly Recorded in the Top Sheet.**

### **INVESTIGATIONS FOR MILD CASES**

1. **Complete Hemogram**- common abnormalities are Leukopenia with Lymphocytopenia  
(On Admission and Daily)
2. **X-Ray Chest PA view** (On admission / every 3<sup>rd</sup> day/ at worsening of symptoms)

#### **Common X-Ray Chest findings**

- Bilateral / Unilateral / Patchy infiltrates
- Ground Glass opacities
- Interstitial Changes

Chest X-ray showing  
bilateral lung opacities

Chest X-ray showing  
extensive bilateral  
ground-glass opacities

Chest X-ray showing  
bilateral, symmetrical  
peripheral consolidation  
with perihilar infiltrates

3. **LFT** - Raised Transaminases, Hyperbilirubinemia  
(Send on Admission / day 4 / day 7 / on Worsening)
4. **Serum Creatinine** - May be raised (Send on Admission / day 4 / day 7 / on Worsening)
5. **ECG** - To look for ST-T changes suggestive of Myocarditis changes and to look for QTc prolongation. Hydroxychloroquine is to be administered cautiously, if QTc is >450 mSecs, and to be avoided if >500 mSecs.  
(To be done on Admission / on Worsening of symptoms)

6. **ABG** : (To be done in moderately or severely ill patients / on Worsening of symptoms)  
Calculate  $PaO_2/FiO_2$  Ratio to find the level of ARDS as described above.

→  $PaO_2$  in this ABG is 71 (as shown)

$FiO_2$  is 0.24, as the was getting Oxygen @ 24% by Nasal Cannula

$PaO_2/FiO_2$  Ratio in this ABG Report is

$71/0.24 = 295.8$

Suggestive of mild ARDS

7. **Nasopharyngeal & Oropharyngeal Swabs for RT-PCR** is not required to be repeated.  
May be done only if the patient is admitted as a suspect and not yet tested before admission.

## **ESSENTIAL BASIC TESTS FOR MILD CASES ON ADMISSION AND ON WORSENING**

**Chest X-Ray, ECG, Complete Hemogram and Blood Biochemistry for Sugar, LFT, Creatinine**

## **ESSENTIAL REGULAR MONITORING FOR MILD CASES AFTER ADMISSION**

**Temperature, SpO<sub>2</sub>, Pulse, Blood Pressure, Sensorium**

## **FEATURES FOR PROGRESSION FROM MILD DISEASE TO MODERATE DISEASE**

1. SpO<sub>2</sub> < 95% at Room Air
2. Stupor, Drowsiness or Confusion
3. SBP <90 mmHg, DBP <60 mmHg
4. Respiratory Rate >24/min
5. HR >100/min
6. Chest X-Ray showing Bilateral infiltrate / Unilateral infiltrate / Ground glass opacity
7. ST-T changes in ECG suggestive of Myocarditis
8. Exacerbation of Comorbid Conditions

## **POOR PROGNOSTIC SIGNS**

1. Neutrophil : Lymphocyte Ratio  $\geq 3.13$
2. Development of Acute Kidney Injury
3. Raised Bilirubin or Liver Enzymes
4. Infiltrates & Ground Glass opacities in Chest X-Ray
5. Type 1 Respiratory Failure in ABG or PaO<sub>2</sub>/FiO<sub>2</sub> ratio <300
6. Hypotension
7. Features of Myocarditis (Trop-T positive)
8. Raised D-Dimer, Serum Ferritin, Lactate level (>2mmol/lit) or Procalcitonin

## **TREATMENT OF MILD CASES**

### **Symptomatic Treatment**

- Rest
- Paracetamol for FEVER
- Antitussive for COUGH
- ORS for DIARRHOEA
- Metered Dose Inhalers for MILD BREATHLESSNESS
- Plenty of Fluids
- Nutritious Diet

## **SPECIFIC TREATMENT FOR CASES IN HIGH RISK GROUP**

- Tab. **Hydroxychloroquine** 400mg BD on Day 1, followed by 400 mg OD for 4 Days

### **HIGH RISK GROUP : Patients with**

- Age > 60 years
- Chronic Lung Diseases
- Chronic Liver Disease
- Chronic Kidney Disease
- Hypertension
- Cardiovascular Disease
- Cerebrovascular Disease
- Diabetes
- HIV
- Cancers
- On Immunosuppressive drugs

## **WHEN TO REFER TO HIGHER FACILITY**

Any patient developing **ANY ONE** of the following:

1. **SpO<sub>2</sub> < 95% at Room Air**
2. **Confusion, Drowsiness**
3. **SBP <90 mmHg, DBP <60 mmHg**
4. **X-Ray Chest PA- showing Bilateral infiltrate / Unilateral infiltrate / Ground glass opacity**
5. **Deranged Liver or Kidney Function**

## **WHEN TO DISCHARGE**

1. **Mild / Very Mild / Pre-symptomatic cases can be discharged after 10 days of symptom onset with no fever for at least 3 days**
2. Swab testing or Chest X-Ray is **not required** for discharge

## **FOLLOW UP**

- **All patients must undergo strict Home Isolation for 7 days after discharge**
- Clinical Follow up at 14th day and 28th day

# **HOME ISOLATION OF VERY MILD, PRE-SYMPTOMATIC CASES**

## **ELIGIBILITY CRITERIA FOR HOME ISOLATION**

1. **Very mild symptomatic cases and pre-symptomatic or asymptomatic laboratory confirmed cases** as clinically assigned by the treating medical officer can opt for home isolation
2. Such cases **should have adequate facility at their residence for self-isolation** and also for quarantine of the family contacts
3. **A care giver should be available at their residence to provide care on 24 x7 basis**
4. **Care giver and all close contacts of such cases should take Hydroxychloroquine prophylaxis** as per protocol and as prescribed by the treating medical officer
5. A **communication link** between the caregiver and hospital for the entire duration is a prerequisite
6. The patient or caregiver will download **Arogya Setu App** from [www.mygov.in/aarogya-setuapp](http://www.mygov.in/aarogya-setuapp) on their mobile and the mobile should remain active at all times through Bluetooth and Wi-Fi
7. The patient will **agree to monitor his health**. For further follow up by surveillance teams, patient and the care giver will **regularly inform** his health status to the District Surveillance Officer
8. The patient will give an **undertaking of self-isolation** (Annexure) and will follow the guidelines
9. In addition to the guidelines available at [www.mohfw.gov.in/Guidelinesforhomequarantine.pdf](http://www.mohfw.gov.in/Guidelinesforhomequarantine.pdf), required instructions for the care giver and the patient as in Annexure II should be also followed

## **WHEN TO SEEK MEDICAL ATTENTION DURING HOME ISOLATION**

Immediate medical attention must be sought if any of the following serious signs/symptoms develop:-

1. **Difficulty in breathing**
2. **Persistent pain or pressure in the chest**
3. **Mental confusion or inability to arouse**
4. **Developing bluish discolorations of lips/face**
5. Or as has been advised by the treating medical officer

## **WHEN TO DISCONTINUE HOME ISOLATION**

Patient under home isolation will end home isolation

1. After 17 days from the onset of symptoms with at least 10 days from the remission of fever
2. After 17 days from the date of sampling for pre-symptomatic or asymptomatic cases
3. There is no need for swab testing by RT-PCR after the home isolation period is over

## **UNDERTAKING ON SELF-ISOLATION (Annexure I)**

I ..... S/W of ....., resident of ..... being diagnosed as a confirmed/suspect case of COVID-19, do hereby voluntarily undertake to maintain strict self-isolation at all times for the prescribed period. During this period I shall monitor my health and those around me and interact with the assigned surveillance team/with the call center (1075), in case I suffer from any deteriorating symptoms or any of my close family contacts develops any symptoms consistent with COVID-19. I have been explained in detail about the precautions that I need to follow while I am under self-isolation. I am liable to be acted on under the prescribed law for any non-adherence to self-isolation protocol.

Signature\_\_\_\_\_ Date\_\_\_\_\_ Contact Number \_\_\_\_\_

## **MANAGEMENT OF MODERATE / SEVERE CASES**

**Same Parameters Like In Mild Cases Should Be Observed During Daily Rounds By Doctor / Sister And Recorded At Least Thrice A Day Or On Worsening Of Symptom**

### **INVESTIGATIONS**

**All Routine Investigations Recommended for Mild Cases Have To Be Sent.**

**Additional Investigations for Moderate / Severe Cases Are As Following: -**

1. Appropriate Cultures Blood / Urine (On Admission / on Worsening of symptoms)
2. For Diabetic patients - FBS, PPBS (as appropriate) [Laboratory / Glucometer]
3. Serum **Ferritin**
4. **Trop-T** / Quantitative Troponins (When Suggestive)
5. Procalcitonin (To rule out secondary infection) - May be normal or mildly elevated
6. CRP
7. LDH
8. **D-Dimer** / PT / INR / APTT / Fibrinogen / Platelets (To rule out DIC)
9. Nasopharyngeal Swab for H<sub>1</sub>N<sub>1</sub> (To rule out Swine Flu)
10. CT Scan Chest (Non-contrast) - If Chest X ray inconclusive or negative and suspicion is high
11. USG Chest: Where expertise available, can be used, as it may help sparing CT scan for all

### **Primary Findings on CT**

- Ground-glass Opacities (GGO): usually bilateral, subpleural, peripheral opacities.
- Crazy Paving Appearance (GGOs and inter-/intra-lobular septal thickening)
- Air Space Consolidation may be seen
- Broncho-vascular Thickening
- Traction Bronchiectasis may be present

### **Temporal CT Changes**

Four stages on CT have been described

- Early / Initial Stage (0 - 4 days): Normal CT scan or GGO only
- Progressive Stage (5 - 8 days): Increased GGO and Crazy Paving Appearance
- Peak Stage (9 - 13 days): Consolidation
- Absorption Stage (>14 days): Abnormalities resolve at one month and beyond

CT chest showing Bilateral Ground Glass Opacities (GGO) without Subpleural Sparing

CT chest showing multifocal bilateral Ground-Glass Opacities with a posterior predominance.

CT chest showing thickened interlobular and intralobular lines with crazy paving appearance

CT chest showing bronchiectasis with a Ground Glass Opacities

CT chest showing sub-pleural bands and architectural distortion

## INVESTIGATIONS TO PREDICT PROGRESSION

### **CBC**

- Monitor lymphocyte count. Lymphopenia is a risk factor for progression to severe disease
- **Neutrophil Lymphocyte Ratio >3.13** is an independent risk factor for severe disease

### **CRP**

- Elevated levels of CRP may be seen in moderate to severe disease.

### **Liver Function Test**

- Raised Transaminases, Hyperbilirubinemia. Acute liver failure in severe cases

### **Renal Function Test**

- Increased creatinine. Acute Kidney Injury in severe disease

### **LDH**

- Elevated LDH levels seen in moderate to severe disease. Marker of Poor prognosis

## **Ferritin**

- Markedly elevated Ferritin level predicts a poor outcome in patients with COVID-19

## **D-Dimer, P-Time, APTT**

- D-dimer >1mcg/ml predicts poor prognosis at an early stage.
- Increased D-Dimer, P-Time, APTT are markers of DIC/ Hypercoagulability and bad prognosis
- Low Molecular Weight Heparin e.g. Enoxaparin 1mg/kg/day Subcutaneously may be considered in patients with very high D-dimer levels (> 6 times normal)

# **SALIENT POINTS IN MANAGEMENT**

## **OXYGEN THERAPY**

- Administer oxygen to all Severe Acute Respiratory Illness (SARI) patients and to patients with respiratory distress / hypoxemia / shock
- Start with nasal prongs @ 5L/min, or Simple Face Mask / Venturi Mask / Non-Rebreathing Mask @ 6-15L/min, as needed
- Titrate for target SpO<sub>2</sub> ≥ 95 %
- Target SpO<sub>2</sub> after initial stabilization: 90-96%

## **INITIAL FLUID MANAGEMENT**

- Conservative fluid strategy if no evidence of shock (0.9% saline / Ringer lactate)
- Cautious IV fluids
- Monitor for worsening of oxygenation during fluid therapy

## **SPECIFIC DRUG THERAPY FOR COVID-19**

- **Tab. Hydroxychloroquine** 400mg BD on Day-1, followed by 400 mg OD on Day-2 to Day-5

### **Contraindications for Hydroxychloroquine:**

1. Children below 12 years
2. QTc in ECG >500 mSec
3. Retinal Pathology
4. Drug Interactions
5. Myasthenia Gravis
6. Porphyria
7. Epilepsy

If initial QTc >450 mSec, perform basic biochemistry and ECG daily. Avoid Quinolones and Macrolides with Hydroxychloroquine, if possible. Monitor QTc closely if these are needed

### **IF THERE IS PROGRESSIVE WORSENING OF CONDITION**

- **Tocilizumab.** May be considered in Moderate / Severe cases, if IL-6 is more than 5 times of the Upper Limit of Normal (ULN). Recommended first dose is 400 mg (4 - 8 mg/kg) in 100 ml NS, over >1 hour. For patients with poor initial efficacy, an additional 400 mg can be repeated after 12 hours. Maximum number of administrations is two times, and maximum single dose is 800 mg. Not recommended in patients with active hepatic disease or hepatic impairment with baseline ALT or AST >1.5 times of ULN
- **Therapeutic Plasma Exchange** May be considered in Moderate / Severe cases, if there is progressive worsening of condition

### **ANTICOAGULATION**

- Low Molecular Weight Heparin e.g. Enoxaparin 1mg/kg/day, Subcutaneously, in moderate to severe patients with marked elevation of D-dimer level, P-time and APTT, which suggest the presence of DIC or Hypercoagulability, or in patients requiring venous thromboembolism (VTE) prophylaxis, unless there is a contraindication

### **GLUCOCORTICOIDS**

- For patients with progressive deterioration of oxygenation indicators, imaging and excessive activation of body's inflammatory response, glucocorticoids can be used for a short period of time of 3 to 5 days. Dose not to exceed the equivalent of Methylprednisolone 1- 2mg/kg/day

### **EMPIRIC ANTIMICROBIALS**

- To add antimicrobials to all patients as early as possible, preferably within the first hour
- Broad Spectrum 3<sup>rd</sup> generation Cephalosporine / Piperacillin Tazobactam / Carbapenem / with or without Aminoglycosides may be selected
- Azithromycin may be added to cover atypical organisms
- Choose drugs to cover all suspected bacteria and influenza (Oseltamivir when suspected)
- Try to send blood cultures before starting antimicrobials; do not delay antimicrobials waiting to send cultures
- De-escalate or stop based on microbiology results or clinical judgment or Procalcitonin

## CONTINUATION OF CHRONIC MEDICATIONS

- **ACE inhibitor /ARB:** Should be continued, if there is no hypotension or any contraindication
- **Statins:** To be continued as same dose
- **Insulin:** To be continued as per blood sugar
- **Immunomodulators:** Decisions to be individualized for prednisolone, biologics and others

## MONITORING

- Monitor vital signs, SpO<sub>2</sub> and/or PaO<sub>2</sub> at regular intervals (every 2 hourly or on worsening)
- Check whether tolerating oxygen therapy → Do not delay intubation if worsening
- If **High Flow Nasal Cannula (HFNC)** is available, can consider a short trial of HFNC in selected patients under close monitoring on worsening of oxygenation. Decrease flow, if possible, to restrict aerosol generation → Do not delay intubation if worsening
- If HFNC not available, can consider a short Non-invasive Positive Pressure Ventilation (NIPPV) trial in selected patients under close monitoring. (Be careful about leaks, as high flow of NIPPV increases aerosol generation. Full face mask / helmet interface preferred) → Do not delay intubation if worsening
- Airborne precautions must during HFNC / NIPPV / Endotracheal intubation
- MDI with spacer preferred to nebulizers, if possible
- CBC / LFT / RFT / portable Chest X-ray / ECG / Lactate / Procalcitonin (every day)
- ABG 6 hourly or more frequently if needed
- D dimer, LDH, Ferritin on admission and on alternate days
- Early detection of myocardial involvement by Troponins, NT-proBNP and Echocardiography
- Other investigations as decided by treating team

## AEROSOL GENERATING PROCEDURES

- Intubation, Extubation, Use of T piece or any other open circuit
- High Flow Nasal Cannula (HFNC), Non-Invasive Positive Pressure Ventilation, Bag Masking
- Open Suctioning
- Bronchoscopy, Tracheostomy
- Cardio-Pulmonary Resuscitation (CPR)
- Nebulisation

## ADDRESS COMORBIDITIES

- Tailor management according to comorbidities

# **MANAGEMENT IN CRITICAL CARE UNIT**

## **CRITERIA OF CRITICAL CARE UNIT ADMISSION**

1. Requiring Mechanical Ventilation
2. Hypotension Requiring Vasopressor Support
3. Worsening Mental Status
4. Multi-Organ Dysfunction Syndrome (MODS)

## **WHEN TO INTUBATE**

1. Features of respiratory fatigue with increased work of breathing and worsening respiratory parameters indicating respiratory failure
2. Haemodynamic instability
3. Altered sensorium with a threatened airway

**Although intubation decision should be individualized, keep a low threshold for intubation.**

## **HOW TO INTUBATE**

- Full complement of PPE with face shield
- Ensure scene safety & check readiness of all essential drugs & equipment prior to procedure
- Most experienced team member to intubate
- Complete airway assessment prior to procedure
- Hemodynamic evaluation & optimization, if needed, prior to procedure
- Use Heat and Moisture Exchanger (HME) filter + Bacterial-viral filter in every oxygenation interface (Face Mask, Circuit, Endotracheal Tube (ETT), Catheter Mount, Laryngeal Mask Airway (LMA))
- Use closed system suctioning
- Pre-oxygenation with 100% oxygen
- Rapid sequence intubation using induction agent (Propofol or Etomidate) and muscle relaxant (Succinylcholine or Rocuronium)
- Limit bag mask ventilation unless unavoidable
- Apply cricoid pressure only in case of ongoing regurgitation
- Use video laryngoscope with separate screen, if available
- In anticipated difficult airway, anaesthesiologist may be called to intubate
- In unanticipated difficult airway, use LMA and simultaneously call for expert help

- Clamp ETT during unavoidable disconnections
- Use end-tidal CO<sub>2</sub> and CXR to confirm correct position of ETT
- After intubation, appropriate cleaning and disinfection of equipment and environment is mandatory

## COVID-19 AND ACUTE RESPIRATORY FAILURE : INVASIVE MECHANICAL VENTILATION

- **Initial Mode:** Volume Control (can use Pressure Control, if Tidal Volume goals are met)
- **Initial Settings**

- Tidal Volume (VT): 6ml/kg Predicted Body Weight (PBW)
- Rate: to match baseline Minute Ventilation (not > 35)

**PBW= In Males:  $50 + 2.3 (\text{Height in inches} - 60)$ ;**

**In Females:  $45.5 + 2.3 (\text{Height in inches} - 60)$**

- **Tidal Volume Adjustment:**
  - Check Plateau Pressure (Pplat)
  - Plateau Pressure Goal  $\leq 30$  cm H<sub>2</sub>O
  - If Pplat > 30: decrease VT by 1ml/kg steps to minimum 4ml / kg
  - If breath stacking (auto PEEP) or severe dyspnea occurs, may increase VT to 7-8 ml / kg, if Pplat remains  $\leq 30$

**Set PEEP according to PEEP-FiO<sub>2</sub> tables to achieve Oxygenation Goal (PaO<sub>2</sub> 55 - 80 mmHg / preferably SpO<sub>2</sub> 90 - 96%)**

**Lower PEEP-Higher FiO<sub>2</sub> Combinations:** (Start with minimum value for a given FiO<sub>2</sub>)

<b>FiO<sub>2</sub></b>	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
<b>PEEP</b>	5	5-8	8-10	10	10-14	14	14-18	18-24

**Higher PEEP- Lower FiO<sub>2</sub> Combinations:**

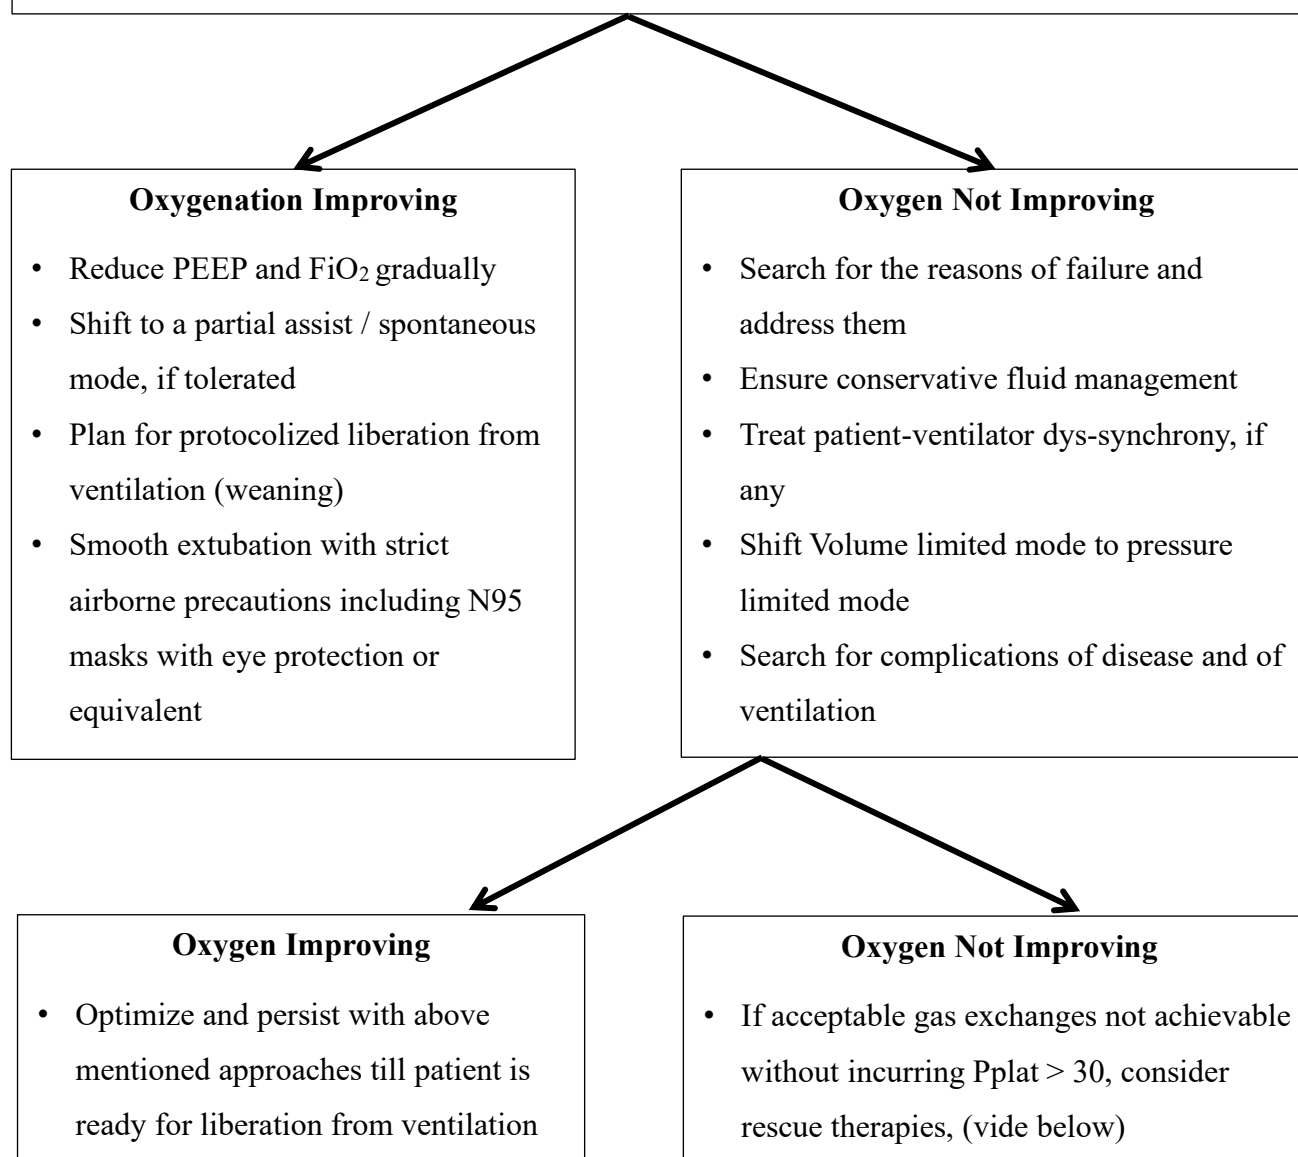

<b>FiO<sub>2</sub></b>	0.3	0.3	0.3	0.3	0.3	0.4	0.4	0.5	0.5
<b>PEEP</b>	5	8	10	12	14	14	16	16	18
<b>FiO<sub>2</sub></b>	0.5	0.6	0.7	0.8	0.8	0.9	1.0	1.0	
<b>PEEP</b>	20	20	20	20	22	22	22	24	

## STRATEGY

- Higher PEEP ( $> 10$ ) in moderate to severe ARDS
- Lower PEEP ( $\leq 10$ ) in mild ARDS and “Non-ARDS like” severe pneumonia
- Continue with higher PEEP, if PEEP responsive (Recruiters) and with lower PEEP, if PEEP non-responsive (Non-recruiters)

**PEEP Responsive (Recruiters) :** Keeping  $\text{FiO}_2$  unchanged, *usually* oxygenation improves with increase in PEEP with minimal / no drop in mean arterial pressure, minimal / no rise in  $\text{PaCO}_2$  and minimal / no rise in driving pressure)

- Try to keep  $\text{Pplat} \leq 30$  and Driving Pressure ( $\text{Pplat} - \text{PEEP}$ )  $< 15$
- **Conservative Fluid Management** in absence of tissue hypoperfusion. Avoid hypervolemia

## **RESCUE THERAPIES**

### **Prone Ventilation**

- Most preferred rescue therapy
- Consider in  $\text{PaO}_2/\text{FiO}_2 < 150$  with a  $\text{FiO}_2 \geq 0.6$  and  $\text{PEEP} \geq 5$  or  $\text{PaO}_2:\text{FiO}_2 \leq 100$  with a  $\text{PaO}_2 \leq 60$  despite optimization of ventilator settings on  $\text{FiO}_2$  of 1
- Consider early proning (within the first 36 hours)
- 12-16 hours / day
- Always check for contraindications and complications

### **Recruitment Maneuvers**

- Consider in PEEP responsive patients
- Preferred method: Sustained high-pressure inflation (35-40 cm H<sub>2</sub>O or CPAP for 40 seconds)
- Avoid staircase manoeuvres ((Incremental PEEP)
- Avoid routine use of recruitment manoeuvres

### **Neuromuscular Blockers**

- Consider continuous infusion for up to 48 hrs in case of persistently high plateau pressures or severe dyssynchrony
- Can use intermittent boluses to facilitate lung protective ventilation, if needed

### **Pulmonary Vasodilators**

- If available, a trial of inhaled prostacyclin or Nitric oxide may be considered, if other rescue strategies have failed

### **ECMO (Extracorporeal Membrane Oxygenation)**

- Consider veno-venous (VV) ECMO, if available, only in selected patients, with refractory hypoxemia despite optimizing ventilation, proning and using other rescue therapies
- Referral to ECMO Centre may be needed

### **Ventilator Precautions / Maintenance**

- Fresh ventilator circuit for every new patient
- HME with Bacterial-Viral filter to be fitted in circuits
- Tubing and HME with Bacterial-Viral filters to change every 48 hours or when visibly soiled
- Use closed suction and avoid routine suctioning
- Avoid unnecessary disconnections. Clamp ET Tube for unavoidable disconnections
- Avoid nebulisations in intubated patients. Use inline MDI instead
- Use standby mode prior to disconnecting the ventilator from the patient to avoid mucus dispersion from the circuit

- Use an inspiratory bacterial and viral filter to assure non-contamination of the internal ventilator gas path
- Protect the expiratory valve with a hydrophobic bacterial filter
- Daily surface cleaning of ventilator during and after usage with disinfectant must.

## REPRESENTATIVE STARTING VENTILATOR SETTINGS

	Volume Control	Pressure Control
<b>Tidal Volume</b>	4 - 8 ml / kg PBW	
<b>Inspiratory Pressure</b>		15 cmH <sub>2</sub> O (Target VT: 4 - 8 ml/kg)
<b>Rate</b>	14 -18	14 -18
<b>Flow (L/min)</b>	20 -30	
<b>Flow Pattern</b>	Decelerating	Decelerating (default)
<b>Inspiratory Time (Ti)</b>		1 - 1.5 secs
<b>I : E Ratio</b>		1 : 1.5 to 1:3
<b>FiO<sub>2</sub></b>	1 (decrease subsequently) Target SpO <sub>2</sub> : preferably 90-96%	1 (decrease subsequently) Target SpO <sub>2</sub> : preferably 90-96%
<b>PEEP (cm H<sub>2</sub>O)</b>	5-10  Target SpO <sub>2</sub> : preferably 90 - 96% Target PaO <sub>2</sub> : 55 - 80mmHg  <i>For subsequent adjustments: Follow PEEP-FiO<sub>2</sub> tables</i>	5-10  Target SpO <sub>2</sub> : preferably 90 - 96% Target PaO <sub>2</sub> : 55 - 80 mmHg  <i>For subsequent adjustments: Follow PEEP-FiO<sub>2</sub> tables</i>
<b>Trigger Sensitivity (Pressure/Flow)</b>	1-4	1-4
<b>Inspiratory Pause</b>	0-0.3 seconds	

## **COVID-19 AND SHOCK : HEMODYNAMIC SUPPORT**

### **FLUID THERAPY**

#### **Strategy of Acute Resuscitation:**

- Individualize, monitoring tissue perfusion
- Conservative strategy preferred to liberal
- Try to avoid hypervolemia

#### **Choice of Fluids**

- Buffered / balanced crystalloids
- Avoid Hydroxy Ethyl Starch (HES) / Dextran / Gelatine / Routine use of Albumin

#### **Assess Fluid Responsiveness, Whenever Possible**

- Use dynamic parameters, for assessing preload responsiveness (e.g. Passive Leg Raising), as feasible

### **VASOACTIVE AGENTS**

- Vasopressor of Choice : Noradrenaline (Vasopressin / Adrenaline if Nor-Ad not available)
- Second line vasopressor: Add Vasopressin
- Mean Arterial Pressure Target : 60 - 65 mm Hg
- Add dobutamine in presence of cardiac dysfunction & persistent hypoperfusion despite fluids and noradrenaline
- Avoid dopamine
- Refractory shock despite fluids & vasopressors: Add IV Hydrocortisone (200mg/day as continuous infusion / intermittent doses)

## **COVID-19 AND RENAL FAILURE : RENAL REPLACEMENT THERAPY**

### **Indications of Dialysis in Acute Kidney Injury (AKI)**

- Volume overload
- Severe metabolic acidosis
- Refractory hyperkalemia
- Uremic encephalopathy
- Uremic pericarditis

### **STRATEGY**

- All modalities of renal replacement therapy can be used depending on clinical status
- Bedside dialysis should be preferred. Portable RO water in a tank may be used, if needed.
- Acute peritoneal dialysis can be tried in selected patients where hemodialysis facility is not available.
- Use of cytokine removal therapies not recommended

## **COVID-19 AND VENOUS THROMBOEMBOLISM : PROPHYLAXIS**

- Routine pharmacologic venous thromboembolism (VTE) prophylaxis is warranted, preferably with low molecular weight heparin, unless there is a contraindication (e.g., bleeding, severe thrombocytopenia).
- Use of more aggressive VTE prophylaxis in the form of increased intensity of a pharmacologic agent or the addition of a mechanical device may be assessed on an individual basis and can be reconsidered as additional data emerge.

## **COVID-19 AND CARDIAC ARREST: CARDIOPULMONARY RESUSCITATION**

- In the event of a cardiac arrest, cardiopulmonary resuscitation should proceed with all members of the team wearing full PPE and N95 mask.
- Practicing a test run of a COVID-19 patient's cardiac arrest is prudent.
- Bag-mask ventilation should be avoided (if feasible) and the ventilator can be used instead to deliver a respiratory rate of 10 beats per minute.
- "Crashes" should be avoided by close monitoring and anticipation. Aim for an elective, unhurried intubation
- Meaningful outcome in refractory critical illness and multiple organ failure is <5%: Assess futility of treatment early

## **COVID-19 AND OTHER ISSUES FOR INTENSIVE CARE SET UP**

- Enteral nutrition
- Glycemic control
- Prevention of hospital acquired infections (VAP, CRBSI, CAUTI).
- Appropriate cultures to be sent. Care for invasive lines and change as per need.
- Early physical therapy
- Stress ulcer prophylaxis. PPI or H<sub>2</sub> blocker
- Protocolised light sedation
- Pressure ulcer prevention by two hourly turning
- Deep vein thrombosis prophylaxis
- Protocolised liberation from ventilation
- Caution about premature extubation (especially without facilitative HFNC / NIPPV) and subsequent reintubation
- Not to use glucocorticoid routinely (if not indicated for some other cause)
- Use point-of-care Ultrasound as much as possible to avoid transfers out of CCU for investigations (e.g. CT scans)

## **TEST FOR VIRAL CLEARANCE FOR DISCHARGE IN MODERATE / SEVERE CASES**

Nasopharyngeal and Oropharyngeal Swab test for RT-PCR is not routinely required excepting in very severe cases with immunocompromised states, e.g. HIV, Transplant recipients and Malignancy. One negative report is required before discharge of such patients.

## **DISCHARGE CRITERIA IN MODERATE / SEVERE CASES**

1. Moderate cases whose symptoms resolve within 3 days and maintains SpO<sub>2</sub> above 95% for next 4 days can be discharged after 10 days of symptom onset if there is absence of fever without Paracetamol, Resolution of breathlessness and No oxygen requirement
2. Moderate to severe cases whose fever does not resolve within 3 days and demand of oxygen therapy continues can be discharged only after Resolution of clinical symptoms and ability to maintain oxygen saturation above 95% for 3 consecutive days
3. Severe Cases (including Immunocompromised patients, HIV patients, Transplant recipients and Malignancy) can be discharged only after Clinical recovery and the patient's swab test becomes negative once by RT-PCR after resolution of symptoms

## **FOLLOW UP**

- All patients must follow strict Home Isolation for 7 days after discharge
- Clinical assessment may be carried out after 14 days and 28 days or as required in between

# **COVID-19 AND PREGNANCY**

## **GENERAL PRINCIPLES**

- Reported cases of COVID-19 pneumonia in pregnancy are milder and with good recovery. Pregnant women with heart diseases are at higher risk of severity
- There is no data suggesting any increased risk of miscarriage or loss of early pregnancy
- COVID-19 is not an indication for Medical Termination of Pregnancy
- There is no recorded case of vaginal secretions being tested positive for COVID-19
- There is no recorded case of breast milk being tested positive for COVID-19
- Vaginal delivery is recommended, if feasible, unless severely ill. If urgent delivery by Caesarean Section is needed, spinal anaesthesia is recommended to minimise the need for general anaesthesia. Always aim to keep the oxygen saturation above 94% during the procedure
- Transmission of the disease from the mother to the baby after birth via contact with infectious respiratory secretions is a major concern
- Mother has to be isolated from the new-born until the mother becomes negative two times by RT-PCR at 24 hours apart. A separate isolation room should be available for the new-born
- The new-born has to be tested by RT-PCR whenever symptomatic.

## **BREAST FEEDING**

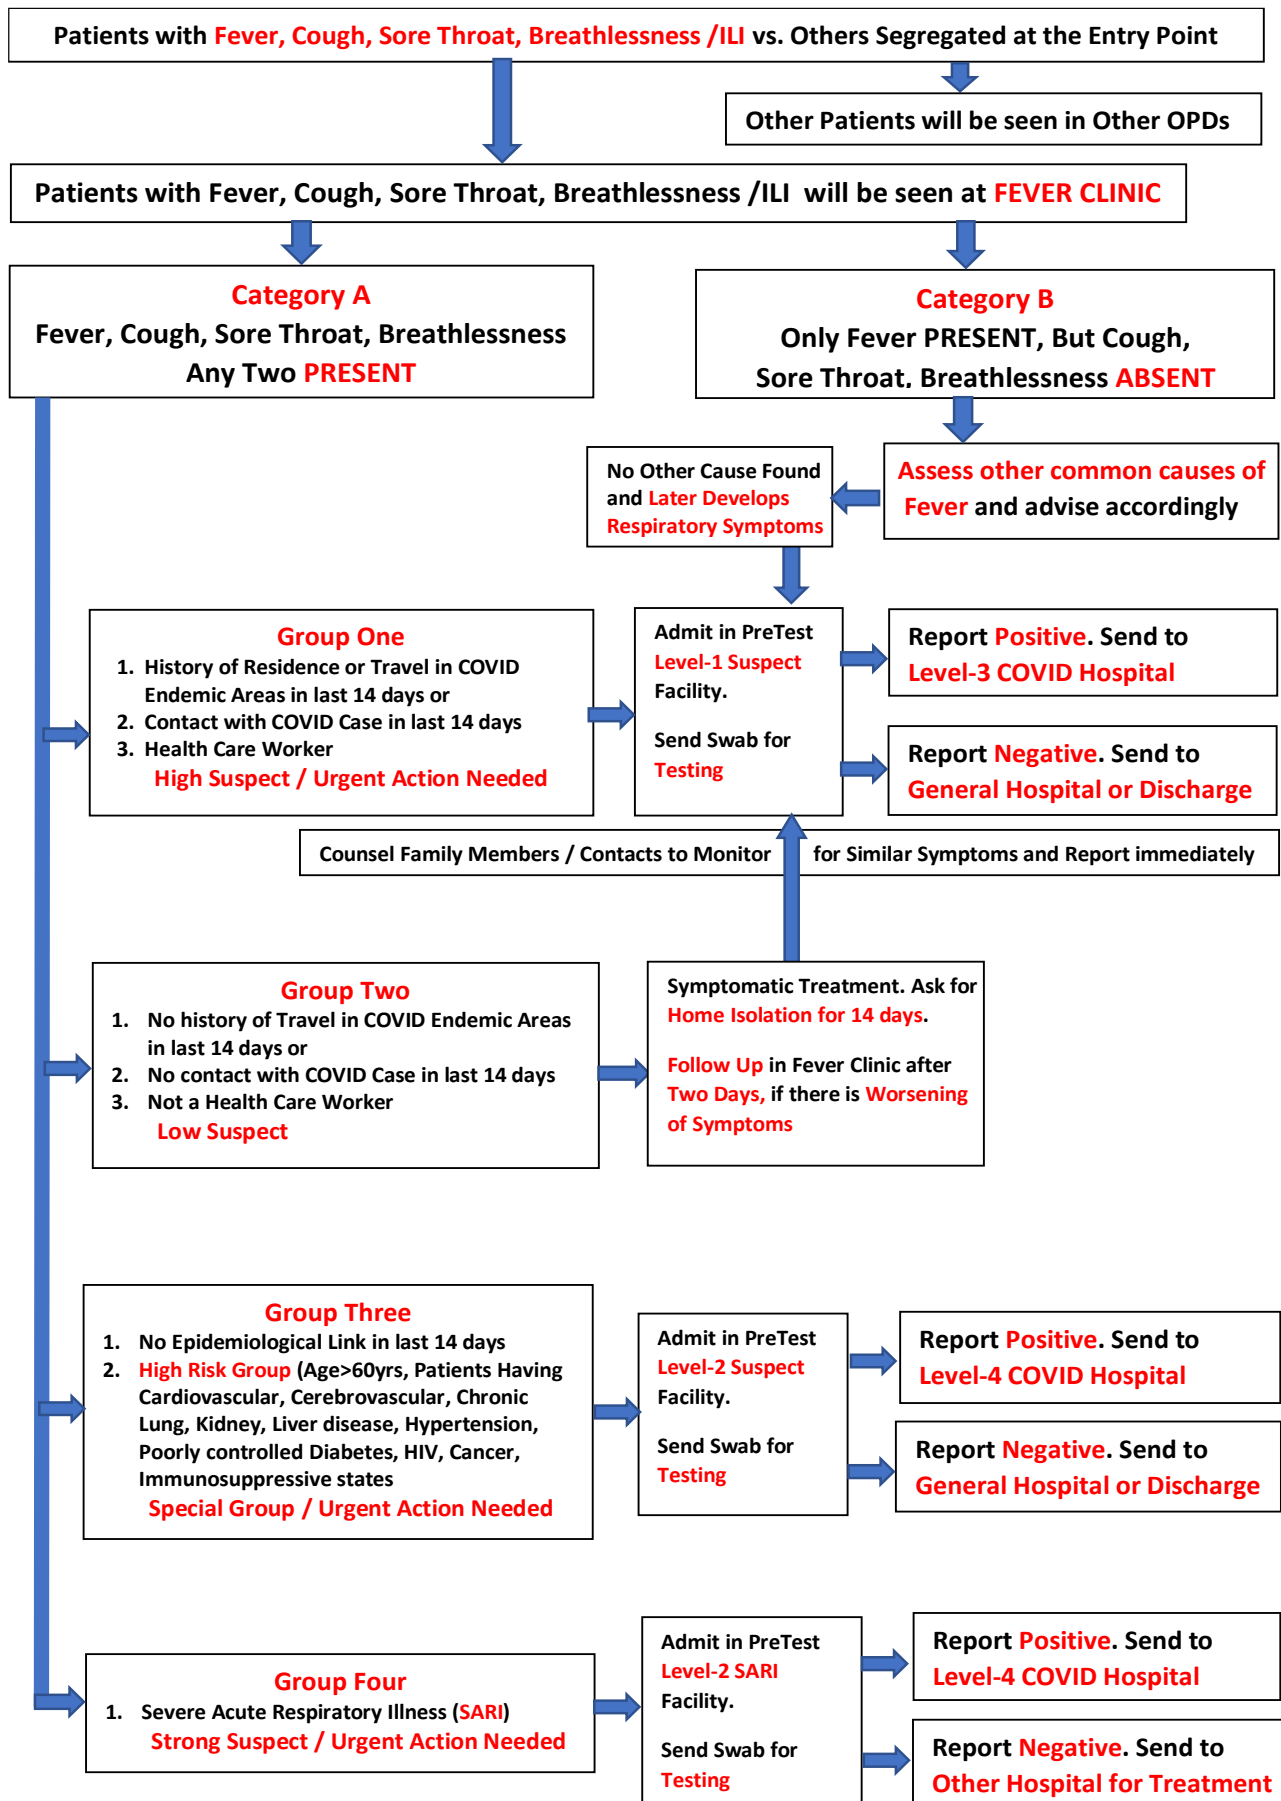

- The risks and benefits of temporary separation should be discussed with the mother
- During temporary separation, if the mother is not seriously ill and she wishes to breastfeed the baby, breast milk can be expressed in a dedicated breast pump, after appropriate hand hygiene. Baby is fed the expressed breast milk by a healthy caregiver after disinfecting the pump
- If the new-born requires “rooming in” with the sick mother in the same room as per the wish of the mother or it becomes unavoidable due to facility limitation, due consideration should be given to implement measures to reduce the viral exposure of the new-born. The mother should always wear a three-layered medical mask
- The decision to discontinue temporary separation should be made on a case-by-case basis after proper consent and after ensuring appropriate measures to reduce exposure of the baby
- If the mother is not too sick and if the mother and baby are kept in the same room, mother can breast feed the baby, after putting on a three-layered medical mask, appropriate hand hygiene and proper cleaning of her breast and nipple before each feeding

## **KEY POINTS**

- If we follow the management protocol for all COVID-19 patients, the recovery rate is satisfactory and the death rate is only around 3% of all the affected persons
- We should address the hypoxia or acute respiratory failure component and multi-organ involvement as early as possible in moderate to severely ill patients to save the maximum number of affected patients
- The patient should be referred to Critical Care Unit in proper time on proper indications
- During the course of treatment, we should always reassure the patient to alleviate his/her fear or panic related to the disease
- HCWs must write the appropriate treatment notes time to time in the management Top Sheet
- Appropriate and adequate self-protection of the HCWs is of paramount importance during patient care.
- Any lack in safety measures and infection prevention is extremely undesirable

# PROTOCOL IN FEVER CLINIC

## DISCHARGE POLICY FOR COVID-19 CASES
